

Popmoney Security and Reliability

Although convenience is important, we know security is always the top priority. From the moment information is sent to Popmoney to the time it is stored and accessed again, it is encrypted using industry leading software, hardware and algorithms. Security measures are taken at each stage of the transaction process to ensure you and your interests are protected. For every initial payment to a new email address or mobile phone number, a one-time passcode is sent to the user to help prevent an unauthorized person from fraudulently depositing someone else's payment. The user must provide that passcode back to Popmoney to verify his or her "ownership" of that mobile number or email address before he or she can deposit the payment.

With Popmoney's extensive safety regulations, you can enjoy peace of mind knowing your information is safe.
